

# Team Ranking

Suppose you are working for a cricket information website(like espnricinfo or cricbuzz) where you have data of several countries and you need to sort them based on certain criterion. The data is given as a list of rows, where each row has the following format

TeamName #Wins #Losses #Draws

Assuming that each Team name is unique, you have to sort team names

- First by decreasing number of wins(i.e team with relatively more number of wins should get lesser rank).
- then by increasing number of losses.
- then by decreasing number of draws.

You could also assume that no two teams have same values for all Wins, Losses and Draws.

For example on the following data

England	4	2	3
India	5	2	4
Australia	6	2	3
SouthAfrica	5	3	4
Bangladesh	3	4	2
Zimbabwe	3	4	6
Ireland	3	4	1

the sorted order is

Australia India SouthAfrica England Zimbabwe Bangladesh Ireland

## Input

List of rows in the format specified above.

## output

Sorted List of team names according to the criterion specified above.
